

Individual Weekly Report

Group: iLab 14-01

Name: Nakul Sidiginamola (25750807)

Project: Assessing the Credibility of Organisational Knowledge from Fragmented Data

Date: 09-Aug-2026 (Week 2)

Individual role: Implementer — Claim Extraction & NLP Lead.

Responsible for leading the design and pipeline implementation to identify and extract factual claims from unstructured organizational data once development begins, focusing on selecting the right NLP tools and claim-parsing frameworks.

Tasks completed this week: Set up the project's GitHub repository (github.com/nakuls198/decidr_data_credibility) and organized its directory structure to prepare for Phase 1 development. Configured standard folders for documentation, source code, data, and notebooks so the team has a clean environment to begin pushing work.

Contribution to project progress: Setting up and organizing the GitHub repository unblocks the team's workflow early, providing a central structure for collaboration and allowing teammates to commit foundational documents like the Group Charter. It establishes a clean environment ready for Phase 1 development and technical experimentation.

Challenges encountered: Aligning the repository folder structure with the expected Phase 1 development pipeline before technical implementation begins and defining the precise scope of what constitutes an extractable "claim" for our specific use case.

Plan for next week: Contribute to the upcoming proposal report (focusing on the NLP and claim extraction approach, aims, and methodology) and begin scoping the initial technical requirements for Phase 1 claim extraction development.

Supporting evidence: Repo created and structured:
